Lab Tasks

Task 1: Write two procedures for input and output, which are capable of getting and displaying data in any format(i.e. Binary, Octal, decimal or hexadecimal). The procedures should accept the output format as parameter and work accordingly.

→ Implement main procedure which:

- 1) Takes input in binary and displays output in octal, hexadecimal, and decimal formats.
- 2) Takes input in octal and displays output in binary, hexadecimal, and decimal formats.
- 3) Takes input in decimal and displays output in octal, hexadecimal, and binary formats.
- 4) Takes input in hexadecimal and displays output in binary, octal, and decimal formats.

Task 2: Implement a program which takes a string input upto 127 bytes from user.

Converts the input to address (show error for wrong input) and displays 128 byte data from that address as dump instruction.

Note:

- Show errors for wrong inputs.
- Your input and output procedures must not duplicate any code or logic.
- Implement separate procedures to avoid duplication of code.
- Names of variables and procedures must be reasonable.(Avoid names like s1, s2, PROMPT, string, msg etc.)
- The user can enter address upto four characters, if less characters are entered, append remaining zeros. i.e. if user enters 2A, convert it to 002A.
- Take base address from data segment address.
